Data Engineering

Abisheck Ashok kumar

Data Engineer | Snowflake · dbt · SQL · Python · AWS | ELT
Pipelines & Cloud Data Warehousing | Available Immediately
Melbourne, Victoria, Australia

Summary

Building data pipelines that move the needle - 15.7% revenue growth is what Snowflake and dbt look like when they're engineered right. I'm a Data Engineer with 3+ years building production-grade ELT pipelines, cloud data warehouses, and data integration solutions at Cognizant - supporting 21 applications across global business units. My core stack is Snowflake, dbt, and AWS (S3, Glue, EMR, Athena), and I bring hands-on depth in SQL, Python, dimensional data modelling, and role-based access control. What I actually do: I take messy, fragmented source systems and turn them into reliable, scalable data pipelines that analysts and scientists can trust. I've designed Talend Cloud workflows that connected disparate business units, implemented Snowflake Time Travel and cloning for zero-downtime data recovery, and built SSRS and Power BI dashboards that translated raw records into decisions for 18+ critical global applications. My background is unusual in the best way: I started in mechanical engineering, which means I think in systems, constraints, and failure modes before I write a single line of SQL. That mindset transfers directly to data quality, governance frameworks, and building pipelines that don't break at 2am. Currently completing a Master's in Information Technology at Victorian Institute of Technology (graduating June 2026) and deepening expertise in dbt modelling best practices, Snowflake performance optimisation, and cloud-native ELT architecture. Open to full-time Data Engineer and Analytics Engineer roles in Melbourne and across Australia. If you're building a data platform and need someone who has shipped pipelines in production, not just tutorials - feel free to message me.

Experience

Cognizant

3 years 4 months

Data & Analytics Engineer

April 2022 - July 2024 (2 years 4 months)

Chennai

- Engineered end-to-end ELT pipelines using Talend Cloud to consolidate data from 10+ source systems into a centralised Snowflake Data Lake, directly contributing to 15.7% revenue growth for the business unit.
- Architected and deployed cloud data warehousing solutions on Snowflake, leveraging AWS S3, Glue, EMR, and Athena for scalable data processing - cutting data retrieval latency across 21 production applications.
- Designed and implemented Snowflake role-based access control (RBAC), data masking, and Time Travel policies, achieving zero data loss across all recovery events and eliminating 100% of unplanned data outages.
- Delivered dimensional data models and complex Talend Cloud workflows across 21 cross-functional applications, enabling seamless data integration and reducing manual intervention by standardising pipeline governance.

Programmer Analyst Trainee

August 2021 - April 2022 (9 months)

Chennai

- Partnered with data scientists and product owners across 18+ critical global applications to translate business requirements into Tableau and SSRS dashboards, surfacing actionable insights for senior stakeholders.
- Enforced data quality and governance standards across 18 production data applications, identifying and eliminating recurring data defects - reducing recurring flaws to zero within the first quarter.
- Designed SSRS reporting solutions processing millions of records from SQL Server, cutting ad-hoc reporting turnaround time by standardising reusable report templates across multiple business units.
- Conducted production support for 18 global data applications, maintaining 99%+ data accuracy and uptime through proactive monitoring and governance checks.

Intern

April 2021 - July 2021 (4 months)

Chennai

- Built a DB2-to-Power BI data pipeline using Informatica ETL, enabling the business to visualise and action critical decisions from previously siloed data within a 4-month delivery window.
- Developed SSRS reports processing millions of records from SQL Server Management Studio, delivering structured and semi-structured data solutions for multiple production use cases.

- Completed advanced Snowflake training including Time Travel, cloning, and performance optimisation - applied directly to specialty insurance data models within the internship period.
- Completed hands-on PySpark and Python training, building predictive models for specialty insurance use cases and expanding pipeline automation capability across the team.

Education

Victorian Institute of Technology (VIT)

Master's in information technology · (July 2024 - June 2026)

Anna University, Chennai

Bachelor of Engineering - BE, Mechanical Engineering · (July 2017 - June 2021)
